# For a Healthy Thyroid

The thyroid gland is essential for maintaining a healthy metabolism. It produces two key hormones – triiodothyronine (T3) and thyroxine (T4) – whose effects are wide-ranging and closely intertwined with other hormonal systems.

T3 and T4 regulate oxygen consumption, the metabolism of carbohydrates, fats, and proteins, and thereby the body's entire energy balance. They also influence the cardiovascular system, digestive function, growth and differentiation processes, as well as mental development in unborn babies and children.

Thyroid is ideal for anyone who, in addition to a balanced diet, wants to supply the body with the key micronutrients that support healthy thyroid metabolism.
